

## Handwriting extraction for classrooms

### Summary

Ideal for classroom applications, the REA-C1000 system uses handwriting extraction technology to extract characters and diagrams written on a white/black board, and displays them in real time - giving an un-blocked view of both the teacher and the content. As the board is now always visible, the system allows the teacher to portray his/her lesson material, thinking process and passion to her students. Even those sat in an awkward place in the room, or in a remote location, can now benefit from an uninterrupted view. This system can be programmed to be operator-free.
